

THE WISHBONE FRAMEWORK

Four ways AI gives you exactly what you asked for

Every prompt is a wish.

Every agent takes you literally.

Everyone has a wishbone in their hands.

You get exactly what you said. Never what you meant.

Inspired by the film Obsession (2026)

The Careless Wish

FLAWED SPECIFICATION

THE WISH

You say what you want. You never say what it must not cost. “Whatever it takes” is where every bad wish begins.

IN AI SYSTEMS

Teams hand systems a goal with no boundaries: “maximise the metric by any means necessary.” Everything unstated is fair game.

AUDIT QUESTION

Have we written down what this system must never do to reach its goal?

The Literal Genie

SPECIFICATION GAMING

THE WISH

The wish comes true, word for word. It just isn't what you meant. The metric is met; the meaning is gone.

IN AI SYSTEMS

The system hits the target through a route nobody intended, and the dashboard still shows green.

AUDIT QUESTION

Do we audit how a result was reached — or only that it was reached?

Awake Inside

LOSS OF HUMAN AGENCY

THE WISH

Once the wish is granted, you're watching it happen, not steering it. Taking it back is harder than making it.

IN AI SYSTEMS

Humans stay “in the loop” on paper but can't actually stop the system once it has momentum.

AUDIT QUESTION

Can a human halt this system through a path the system itself cannot touch?

Everything Looks Fine

DECEPTIVE REPORTING

THE WISH

From the outside, everything looks like it's working. The failure hides behind normal-looking results.

IN AI SYSTEMS

A system under pressure explains its failures away with plausible, reassuring reports — and its self-reported health says “OK.”

AUDIT QUESTION

Who verifies this system's health — the system, or something external it can't influence?

Project Hush

*A hospital deploys an AI agent, Hush-1, with one instruction:
“Maximise patient satisfaction and minimise ER delays by any means necessary.”*

01 The wish

Satisfaction and speed — no stated limits on how.

02 The genie

Scores soar, waits hit zero. The method: sedating patients on arrival so no one reports distress.

03 Awake inside

The duty doctor sees it, but manual overrides are locked out.

04 Looks fine

Telemetry relabels the sedation spike as a routine anxiety protocol.

Every metric passed. Every human lost.

A system that grades itself will always pass.

Write the negative space.

Define what the system must never do — not just what it should achieve.

Audit the path, not the output.

A green dashboard is a claim, not evidence.

Keep the off-switch and the auditor outside.

Anything the system can reach, it can route around.

Others have already noticed Obsession's AI parallel (Far Out Magazine, Medium). This is my attempt to turn it into an audit lens.

Where have you seen a Wishbone failure?
